

Meteor Activity Outlook for August 13-19, 2022

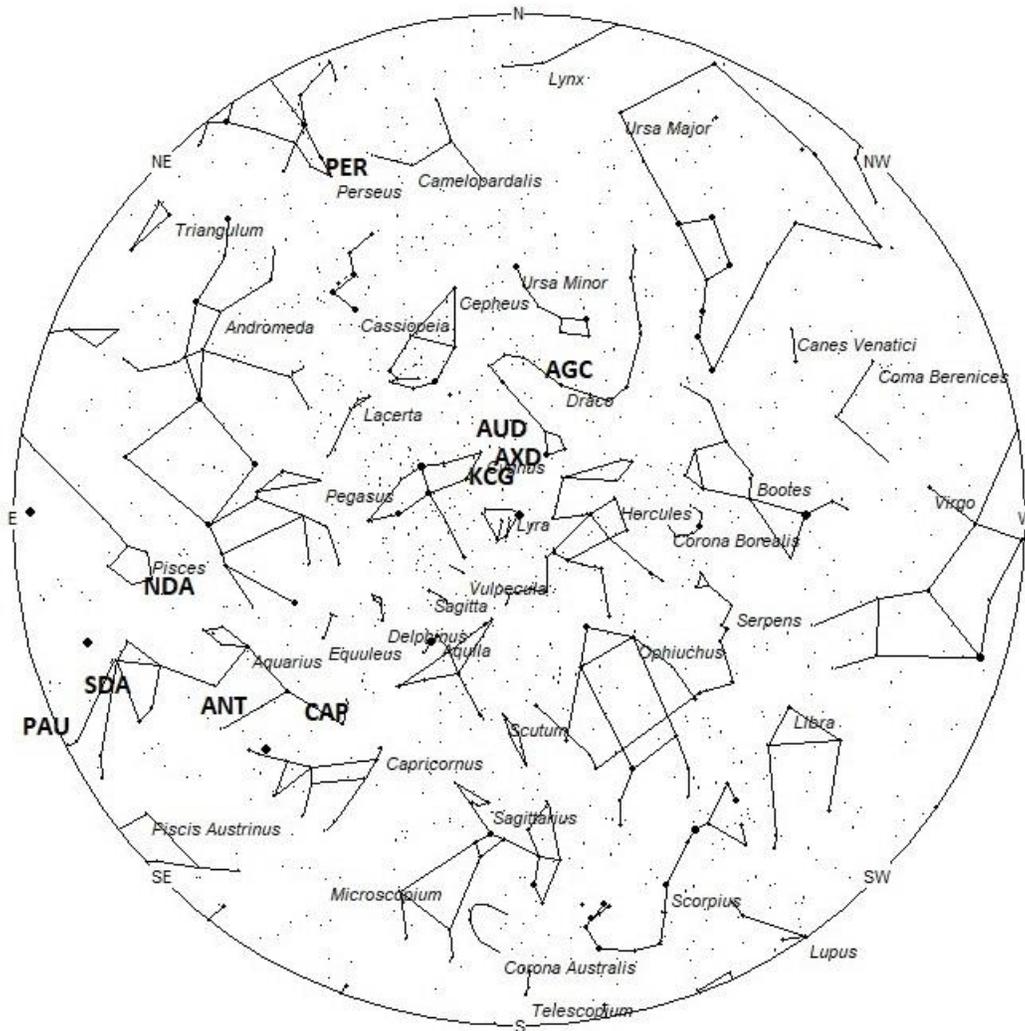

Daniel Bush captured this fireball low in the eastern sky at 04:33 UT on June 3rd 2022 (23:33 CDT on June 2, local date), from Albany, Missouri USA. For more information on this fireball visit: https://fireball.amsmeteors.org/members/imo_view/event/2022/3253 ©Daniel Bush

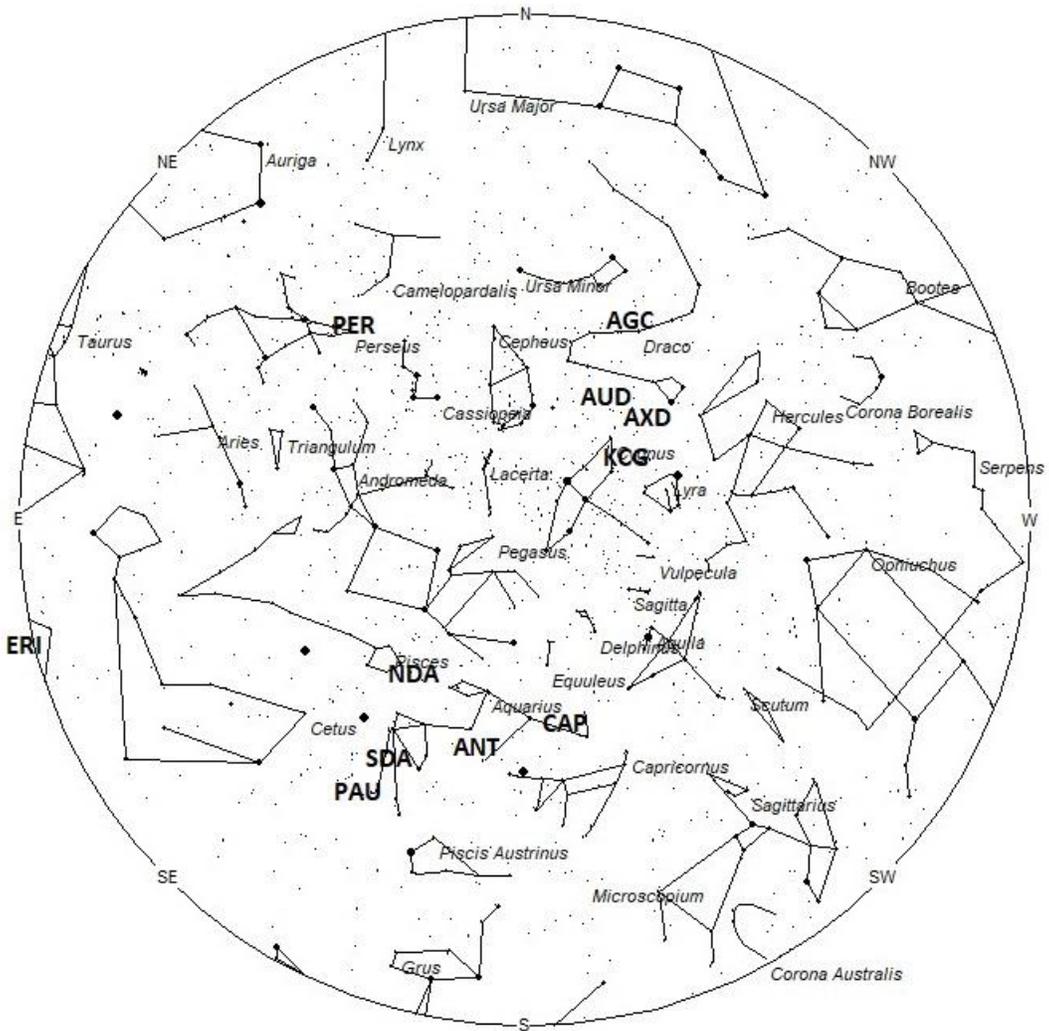

During this period, the moon reaches its last quarter phase on Friday August 19th. At that time the moon is located 90 degrees west of the sun and will rise near midnight local Daylight Saving Time (LDST). This weekend the waning gibbous moon will rise during the early evening hours, only allowing a brief time to view meteor under dark skies between dusk and moon rise. The estimated total hourly rates for evening observers this week should be near 2 as seen from mid-northern latitudes (45N) and 2 as seen from tropical southern locations (25S) For morning observers, the estimated total hourly rates should be near 23 as seen from mid-northern latitudes (45N) and 11 as seen from tropical southern locations (25S). The actual rates will also depend on factors such as personal light and motion perception, local weather conditions, alertness, and experience in watching meteor activity. Rates are reduced during this period due to moonlight. Note that the hourly rates listed below are estimates as viewed from dark sky sites away from urban light sources. Observers viewing from urban areas will see less activity as only the brighter meteors will be visible from such locations.

The radiant (the area of the sky where meteors appear to shoot from) positions and rates listed below are exact for Saturday night/Sunday morning August 13/14. These positions do not change greatly day to day so the listed coordinates may be used during this entire period. Most star atlases (available at science stores and planetariums) will provide maps with grid lines of the celestial coordinates so that you may find out exactly where these positions are located in the sky. I have also included charts of the sky that display the radiant positions for evening, midnight, and morning. The center of each chart is the sky directly overhead at the appropriate hour. These charts are oriented for facing south but can be used for any direction by rotating the charts to the desired direction. A planisphere or computer planetarium program is also useful in showing the sky at any time of night on any date of the year. Activity from each radiant is best seen when it is positioned highest in the sky, either due north or south along the meridian, depending on your latitude. It must be remembered that meteor activity is rarely seen at the radiant position. Rather they shoot outwards

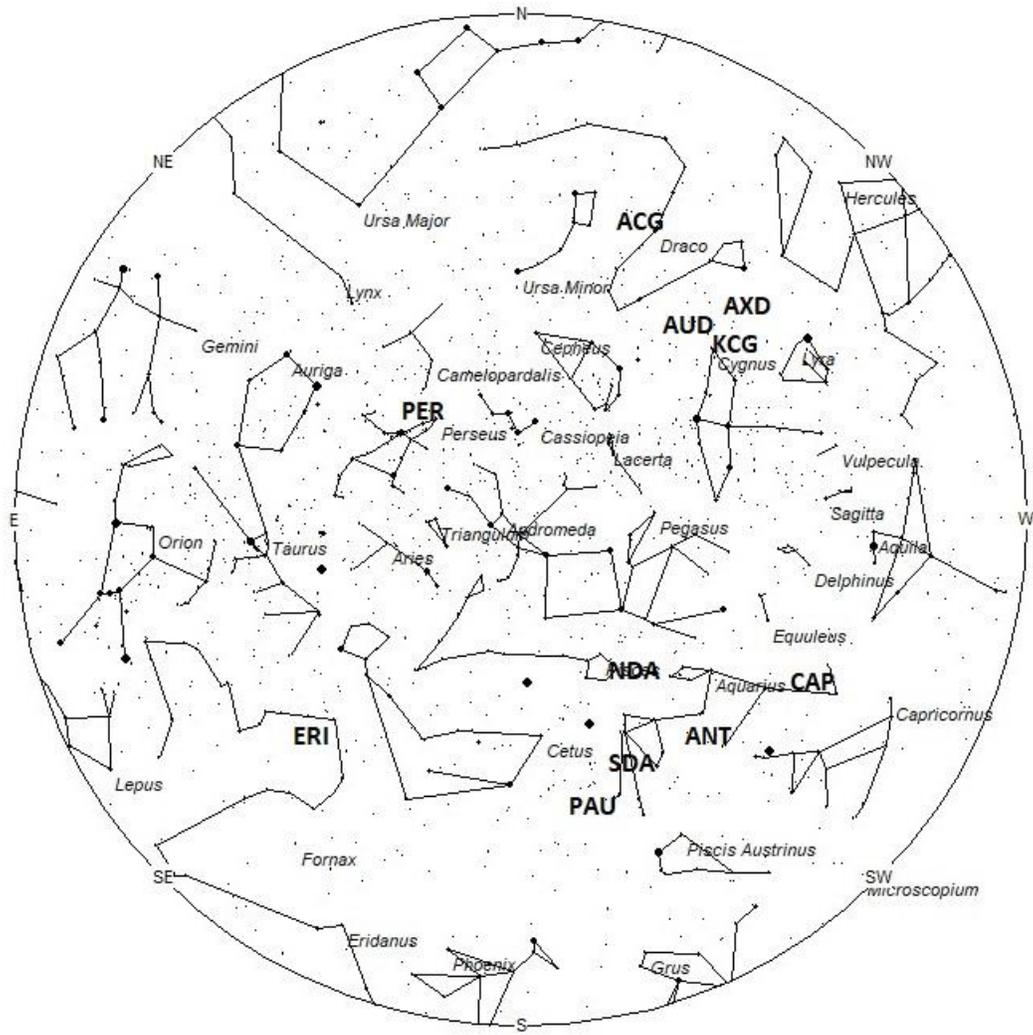

from the radiant, so it is best to center your field of view so that the radiant lies at the edge and not the center. Viewing there will allow you to easily trace the path of each meteor back to the radiant (if it is a shower member) or in another direction if it is sporadic. Meteor activity is not seen from radiants that are located far below the horizon. The positions below are listed in a west to east manner in order of right ascension (celestial longitude). The positions listed first are located further west therefore are accessible earlier in the night while those listed further down the list rise later in the night.

Radiant Positions at 10pm Local Daylight Saving Time

Radiant Positions at 1am Local Daylight Saving Time

Radiant Positions at 4am Local Daylight Saving Time

These sources of meteoric activity are expected to be active this week.

Details of each source will continue next week when lunar conditions are much more improved.

You can keep track of the activity of these meteor showers as well as those beyond the limits of visual observing by visiting the NASA Meteor Shower Portal available at:

<https://meteorshowers.seti.org/> You can move the sky globe to see different areas of the sky.

Colored dots indicate shower meteors while white dots indicate sporadic (random) activity. The large orange disk indicates the position of the sun so little activity will be seen in that area of the sky.

The list below offers the information from above in tabular form. Rates and positions are exact for Saturday night/Sunday morning except where noted in the shower descriptions.

SHOWER	DATE OF MAXIMUM ACTIVITY	CELESTIAL POSITION	ENTRY VELOCITY	CULMINATION	HOURLY RATE	CLASS
		RA (RA in Deg.) DEC	Km/Sec	Local Daylight Saving Time	North- South	
August Gamma Cepheids (AGC)	Aug 29	16:59 (254) +71	41	21:00	<1 - <1	IV
August xi Draconids (AXD)	Aug 15	18:27 (277) +52	20	23:00	<1 - <1	IV
kappa Cygnids (KCG)	Aug 14	19:05 (286) +50	22	00:00	<1 - <1	II
zeta Draconids (AUD)	Aug 26	19:20 (291) +57	23	00:00	<1 - <1	IV
alpha Capricornid s (CAP)	Jul 31	20:53 (313) -06	19	01:00	1 - <1	II
Anthelion (ANT)	-	22:16 (334) -11	30	02:00	<1 - 2	II
Northern delta Aquariids (NDA)	Aug 12	23:08 (347) +02	39	03:00	<1 - <1	IV

Southern delta Aquariids (SDA)	Jul 31	23:20 (350) -14	38	03:00	<1 - 1	I
Piscids Austrinids (PAU)	Aug 07	23:52 (358) -18	43	03:00	<1 - <1	IV
beta Hydusids (BHY)	Aug 17	02:25 (036) -75	23	05:00	<1 - <1	IV
eta Eridanids (ERI)	Aug 06	03:08 (047) -11	64	06:00	<1 - <1	II
Perseids (PER)	Aug 13	03:18 (050) +58	59	06:00	15 - 5	I
